

Microsoft

Average Rating vs. Total Runtime

Question 1 Insights

- There is no readily apparent correlation between total runtime and the average rating of a movie based on the information in the data tables. Microsoft should focus on making movies within 1 standard deviation (± 22 minutes) of the mean of 95 minutes and they won't have an issue with viewers thinking movies are too long or too short.

Total Gross Scatter Plot

Question 2 Insights

- As we can see in the question 2 scatter plot, there is only a slight correlation between average rating and the total gross of a movie. The higher quality a movie is, the more likely it is to gross more at the box office.

Average Gross Scatter Plot by Genre

Top 15 Genres by Average Worldwide Gross

Question 3 Insights

- Adventure, Action, Fantasy, and Sci-Fi movies are all heavily featured as the highest grossing films. Microsoft should begin by focusing on some of these more popular genres in an effort to enter the market, even if there is low ROI up front. Creating good cornerstone content now will be a great foundation for creating profits in the future.
- Future work - show a graph of ROI for these genre combinations within this graph using a second y axis on the right. I believe this would be valuable information since my insight for question 3 was to build quality content within these genres in order to establish a foundation that will attract consumers and subscriptions to Microsoft's content.

Top 20 Genres by ROI

Question 4 Insights

- There are some extremely high ROI's for certain combinations of genres. After establishing a solid foundation of quality content and a user base supportive of that content, we advise that Microsoft utilize less than the average for production budgets while diversifying content rapidly. A focus on finding material to develop in the Horror, Thriller, Mystery, and Sci-Fi will provide return in investment in the long run. Instead of Microsoft heaping money at projects that have the possibility to underperform without any rewards, Microsoft should first establish quality original content.

Future Work

- A larger more complete dataset that provides more data points in terms of revenue and also budgets
- Further breaking down individual genres in order to target one specific genre at a time
- Creating a trend over time to spot changes in the movie making market
- Incorporate specific directors to the analysis to determine who specifically makes the most profitable movies
